NEXUS

AI Career Navigator

Connect your starting point
to work worth exploring

Personal evidence → occupational requirements
→ a practical next experiment

Real product · English / Simplified Chinese / Malay

Work is changing faster than a static career label

Students and workers need to decide what to learn next, with evidence they can inspect.

620,000

employees expected to be significantly impacted in Malaysia

TalentCorp Phase 1: about 18% within ten analysed sectors. AI, digitalisation and the green economy; impact does not mean job loss.

39%

of existing skill sets expected to change or become outdated

WEF global employer outlook, 2025–2030. A system-wide expectation, not an individual prediction.

Sources: TalentCorp Impact Study (Phase 1); World Economic Forum, Future of Jobs Report 2025

A decision trail from uncertainty to a next experiment

One connected product flow keeps answers, sources, requirements and actions traceable.

Revisit

What If scenarios
and new evidence

Every recommendation should answer: Why this direction, what is unknown, and what can I test next?

Understand the person before comparing the work

Two questionnaires separate personal context from direction-specific self-report.

01 Starting point

Life stage, concerns, experience, constraints, goals, markets and actual AI practices.

02 Direction exploration

Twelve seven-level items: four common questions and eight for the chosen direction.

10

career directions with bounded occupational coverage

Self-report stays self-report.
AI-tool use does not establish development skill.
Unknowns become verification tasks.

Occupational facts keep their source, date and geography

A reviewed snapshot is useful only when its limits remain visible.

20 + 7

O*NET occupation records + ESCO classification records

Selected reference coverage. No claim of a complete labour market.

O*NET / ESCO	Tasks, skills and occupation relationships US / European classification
DOSM / MASCO / MyCOL	Regional context and reviewed software evidence Malaysia; bounded scope
BLS / World Bank	Published occupational / national context Do not convert into personal fit

Current inspected knowledge snapshot verified 24 October 2026 · dated data, not live vacancies

Personalised guidance exposes evidence and unknowns

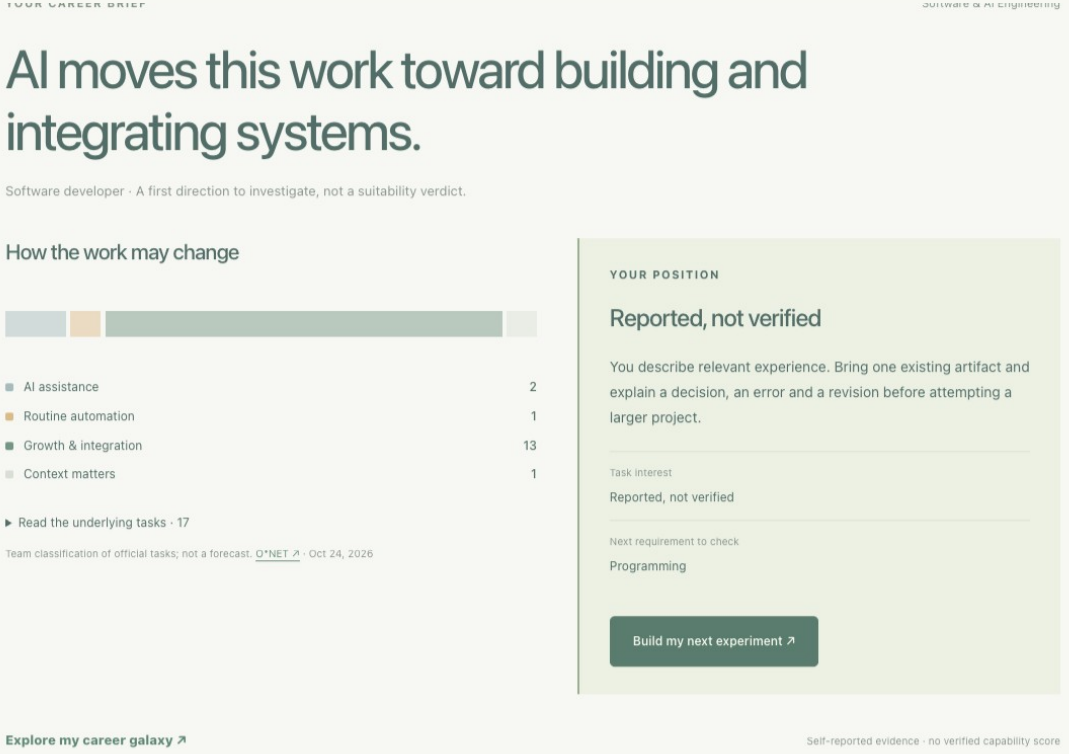

A requirement becomes useful when it leads to a feasible learning task.

Reported experience

Compare it with occupational requirements.

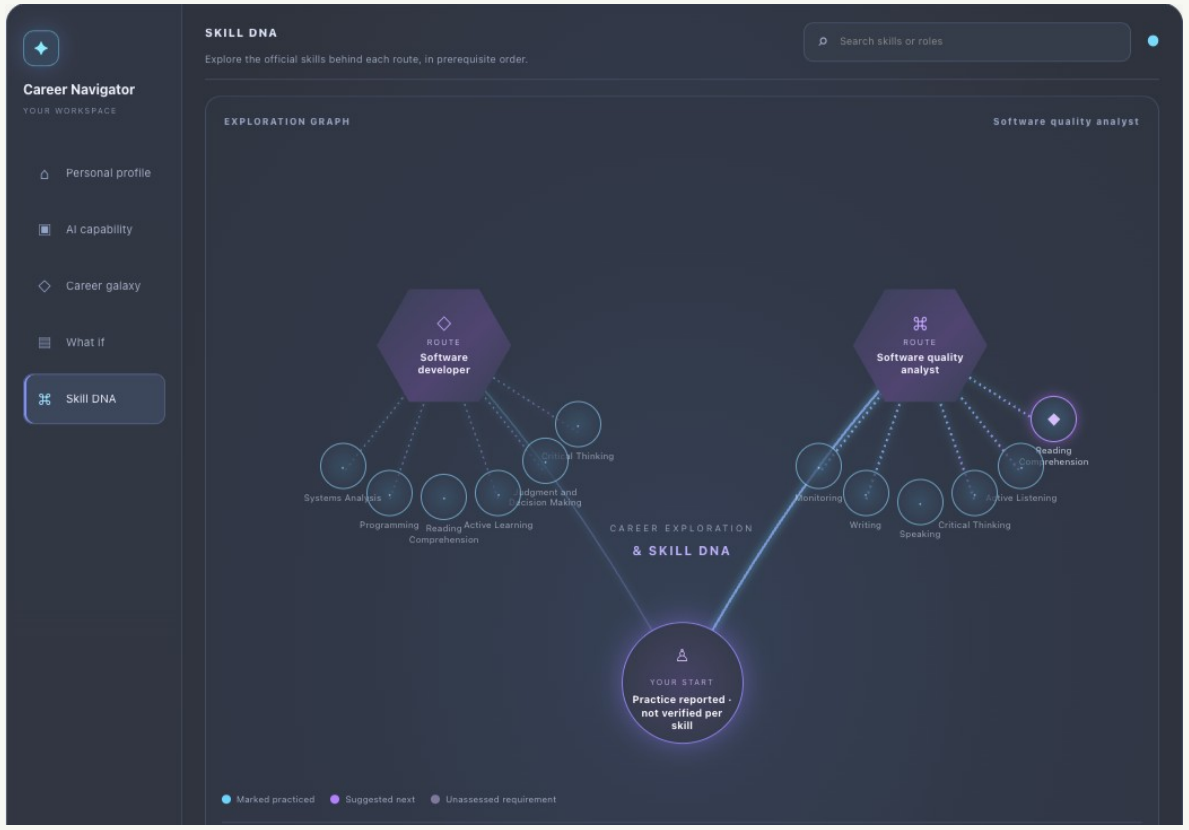

Choose one next check

Build, test and document an artifact. The plan estimates effort; it does not certify a skill.

Career Constellation makes requirements inspectable

Our interactive visual map connects career routes, comparison and Skill DNA.

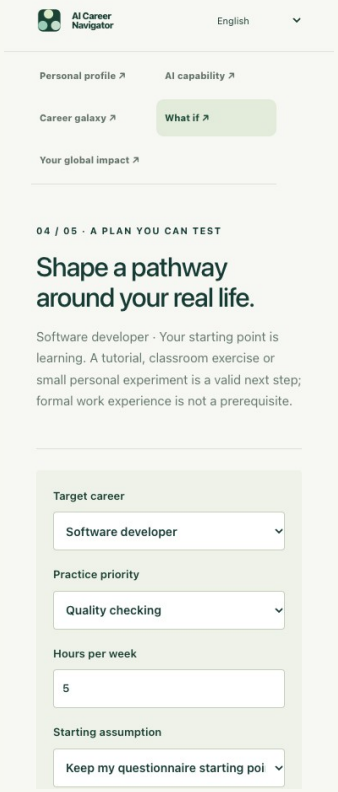

Explore two routes

Inspect source-linked requirements and the next practice to verify.

Graph links support exploration.
They are not proven migration pathways or skill certificates.

What If turns a plan into a comparison you can test

Hypothetical time, priorities and starting assumptions stay separate from original answers.

Change the budget, inspect the pathway

Target role + practice priority + hours per week
→ prerequisite-ordered tasks and milestones

Scenario inputs do not rewrite the baseline.
More study time does not create mastered skills.
Reset returns to the original plan.

A local core with optional, constrained model interpretation

The core report remains usable when the model or an external source fails.

RUNPOD · OPTIONAL

Qwen3-4B-Instruct-2507
schema + evidence-ID
validation

Explicit consent · backend-only API keys · bounded payloads · no automatic paid retry

Live prototype on Replit. The AI interpretation option depends on consent and runtime configuration.

From career exploration to measurable learning actions

The existing 17-goal SDG view supports a focused Domain 1 impact pathway.

4 QUALITY EDUCATION

Target 4.4

Relevant skills → a practical learning artifact

8 DECENT WORK

Targets 8.2 / 8.5

Better-informed preparation for changing work

9 INNOVATION

Target 9.5 · supporting

Explore technical and research capability

Proposed pilot: ≥80% of 10 participants identify a sourced next action; 100% of reviewed plans respect their weekly budget. These are targets, not achieved outcomes.

A stronger starting point for a career decision

Evidence-linked exploration, visible uncertainty and a next experiment the user controls.

What makes NEXUS different

Traceable personal evidence
Source-scoped occupational requirements
Visual route and skill exploration
Baseline-preserving What If planning
A core report independent of generation

Next phase

Review more occupational mappings
Run the proposed usability pilot
Validate learning-task completion
Audit model explanations and fairness
